## Exhaust abatement system

### Technology Data

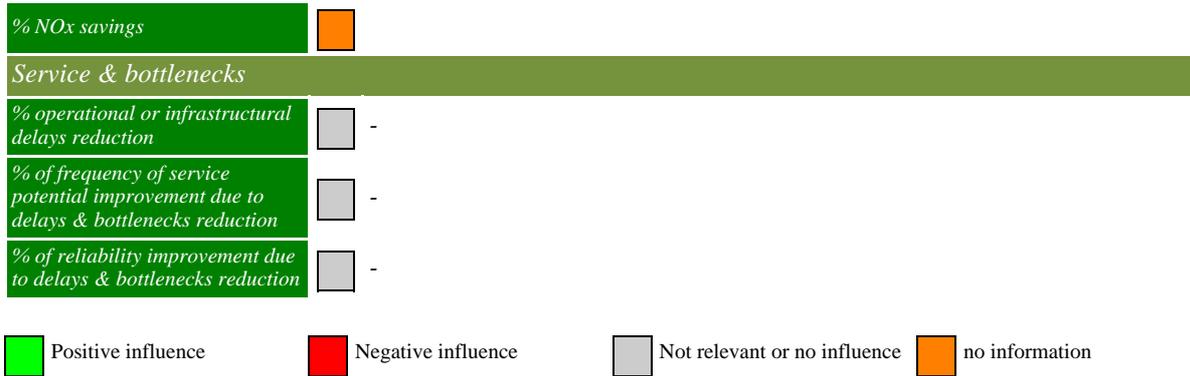

ID	Category	Transport modes	
EN21	Engines and Propulsion Systems	Maritime, Inland Waterways	
Description			
Emission reduction system comprising a reactor for selective catalytic reduction of NOx and a reactor containing a particulate matter filter for reduction of particulate matter			
Readiness Level	Time to Market	Energy Source	Efficiency
9	<1	MGO	0
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
Increase by 2%	Reduction by 90%	Increase by 2%	0

### Notes on technology

Applicability on the maritime sector: Under the IMO air pollution regulations, exhaust gas cleaning systems, like scrubbers, are one option to mitigate sulfur emissions, with alternative fuels like LNG or low-sulfur marine diesel oil being the other technically known option. Scrubbers can remove sulphur from the engine exhaust gas up to 99% by using chemicals, seawater, or dry scrubbing technology. However, the scrubber operation increases the power consumption, thereby increasing the CO<sub>2</sub> emissions. In addition, the scrubber installation requires alterations on-board the vessel, like the installation of additional tanks, pipes, pumps, water treatment system (in case of wet scrubber systems), and sludge tank (the sulfur-rich sludge is treated as special waste). Extra operational costs may be required, if chemicals solvents are in use. Applicability on inland waterways: The application of a Selective Catalytic Reduction (SCR) system on the exhaust gas path of the inland water way vessel is considered. SCR is a technique to remove NO<sub>x</sub> emissions by means of injecting a urea agent (32.5% in water) into the exhaust gas stream. The urea substance reduces both NO and NO<sub>2</sub> to nitrogen and water. According to the high-level benchmark, the SCR technology would require additional operating costs for urea and maintenance. In addition, it could bring a 2-5% fuel increase. On the other hand, according to, NO<sub>x</sub> after-treatment gives the opportunity to increase combustion efficiency, resulting in up to 7.5% less fuel consumed and less CO<sub>2</sub> emitted. Considering that both approaches could be realised, a range of -2% to +7.5% for the fuel cost factor is assumed.

### High Level Benchmark

Baseline	No exhaust abatement system.	
Relative Cost		
% cost savings during operation	<span style="color: green;">■</span>	SOX scrubber: Savings in reduced OPEX exceed the increase of CAPEX
CAPEX	<span style="color: orange;">■</span>	-
% fuel savings	<span style="color: red;">■</span>	2 - 3% (SOX scrubbers)
Emissions		
% CO <sub>2</sub> savings	<span style="color: red;">■</span>	2 - 3% (SOX scrubbers)
% SO <sub>x</sub> savings	<span style="color: green;">■</span>	90-95% (SOX scrubbers) This assumes comparison with High Sulphur Fuel

## Mechanical azimuthing thrusters

### Technology Data

ID	Category	Transport modes	
EN06	Engines and Propulsion Systems	Maritime	
Description			
The engine runs generator. An electric motor is located inside the ship where it runs propeller shaft. 20 year life time, running 5500 h/a.			
Readiness Level	Time to Market	Energy Source	Efficiency
8	<1	HFO	27
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
1960	33	37	28100

### Notes on technology

This is a technology that can result in energy savings depending on the user. It is a baseline technology. Currently, and compared to a traditional propulsion system (e.g. mechanically connected propeller), procuring such technology will result in an increased capital expenditure, while at the same time opening up for potential fuel savings in the range of up to 20% (i.e. increased capital cost and reduced operating cost). Although the savings in energy consumption are fully dependent on the user of the technology, this naturally also has the corresponding effect on the emission of CO<sub>2</sub> and SO<sub>x</sub>. The KPIs average speed, frequency of service and reliability are not likely to be affected by the introduction of mechanical azimuth thrusters.

### High Level Benchmark

Baseline	<i>Mechanically connected propeller by reduction gear to the propeller shaft, thruster assisted</i>	
Relative Cost		
% cost savings during operation	<span style="color: green;">■</span>	Potential lower OPEX

## Counter rotating propeller

### Technology Data

ID	Category		Transport modes
EN61	Engines and Propulsion Systems		Maritime
Description			
Thrust system consisting of a pair of propellers behind each other which rotates in opposite directions, so that the aft propeller recovers some of the rotational energy in the slipstream from the forward propeller			
Readiness Level	Time to Market	Energy Source	Efficiency
0	0	Wind	0
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
4% reduction estimated by 2050	0	0	0

### Notes on technology

Although the technology is more expensive than a single propeller system, it holds the possibility to provide fuel savings in the range of 5-15%. Although the idea and technology cannot be regarded as new, it holds the potential of significantly reducing the energy consumption. Since the cost of contra rotating propellers mostly refers to the point of installation/ acquisition, it is assumed that it has no significant impact on the transport cost. This means if installed in a vessel it will increase the capital cost in comparison to a vessel without this technology. However, in terms of energy savings the technology has a potential to provide savings in the range of 5-15% for CO<sub>2</sub>, SO<sub>x</sub> and NO<sub>x</sub>. The average speed will not be affected, but the technology allows for installation of less engine power, meaning that less energy is needed to maintain the same vessel speed. This means that average speed, frequency of sailing, and reliability can be maintained by consuming less energy.

### High Level Benchmark

Baseline	Single rotating propeller	
Relative Cost		
% cost savings during operation	<span style="color: green;">■</span>	Reduced OPEX (depends on vessel type and operational profile)
CAPEX	<span style="color: red;">■</span>	higher CAPEX (depends on vessel type)

## LNG

### Technology Data

ID	Category		Transport modes
FU08	Fuels and sources of energy		Inland Waterways, Maritime, Railway, Road
Description			
Liquefied natural gas			
Readiness Level	Time to Market	Energy Source	Efficiency
8	<1	Natural gas	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
IWW: Reduction by 10 up to 25 % compared with diesel engine (CCNR I Standard)	IWW: Reduction by 98.5 % compared with diesel engine (CCNR I Standard)	IWW: Reduction by 100 % compared with diesel engine (CCNR I Standard)	-

### Notes on technology

Natural gas (NG) is a cleaner alternative to diesel fuel oil, offering environmental and economic benefits from the reduced emissions, price and taxation. As a fuel, it is compressed (CNG) or liquefied (LNG) and it is characterised by high methane concentration and close to zero sulfur and PM content, compared to diesel fuel oil. LNG for shipping is a proven and safe technology, and an alternative to after-treatment systems to reduce SO<sub>x</sub>, NO<sub>x</sub> and PM emissions. LNG is currently used by 30 vessels, as of July 2012, and the new-building order book has approximately the same number of ships. The interest on LNG will increase in the future due to the environmental regulations on sulfur (MARPOL 73/78 Annex VI) and carbon emissions (Energy Efficiency Design Index and Ship Energy Efficiency Management Plan, IMO 2011), and the estimated lower fuel consumption. The estimated CO<sub>2</sub> emissions reduction is 20-25% compared to diesel oil. There are two challenges regarding this reduction: first, the unburned methane (the so-called methane slip) and, second, possible release of methane through the total NG transport chain. Using LNG as a marine fuel, NO<sub>x</sub> emissions are reduced by 90%, and SO<sub>x</sub> and PM emissions are eliminated. The main engine specific fuel consumption is lower for the LNG case (including the pilot fuel) compared to marine diesel oil (3.5% at maximum continuous rating, MCR). Large vessels can benefit more from LNG compared to small ones, due to the economy of scale in the installation. Another important benefit of natural gas is that the noise level reduces during trip. From a technical point of view, the installation of the cryogenic LNG fuel tanks may require a reduction in cargo capacity. This depends on the type of vessel and system complexity. The price of LNG varies from country to country and according to EIA and IEA projections, the LNG price is likely to rise to \$400-1200 per tonne in 2035, starting from a range of \$300-800 per tonne in 2010. Regardless of price uncertainties, LNG is the cleanest of fossil fuels and it is a viable solution to reduce carbon, NO<sub>x</sub>, SO<sub>x</sub> and PM emissions. The development of LNG terminals at strategic points across Europe would facilitate the adoption of LNG as a marine fuel in the future.

## Biogas

### Technology Data

ID	Category	Transport modes	
FU18	Fuels and sources of energy	Inland Waterways, Maritime, Railway, Road	
Description			
Biogas is mainly produced from bio-wast, agricultural recidues and residues from sewage treatment plants			
Readiness Level	Time to Market	Energy Source	Efficiency
1	<1	Chemical	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
Road: Typically 80-90% below liquid fossil fuels; IWW: Typically 80-90% below liquid fossil fuels	Road: very low; IWW: Reduction by 98.5 % compared with diesel engine (CCNR I Standard)	Road: very low; IWW: Reduction by 100 % compared with diesel engine (CCNR I Standard)	-

### High Level Benchmark

Baseline	ULSD
Relative Cost	
% cost savings during operation	-
CAPEX	-
% fuel savings	40% cheaper from diesel
Emissions	
% CO <sub>2</sub> savings	For TTW: For WTW: 80-90% less than liquid fossil fuels
% SO <sub>x</sub> savings	-
% NO <sub>x</sub> savings	-
Service & bottlenecks	
% operational or infrastructural delays reduction	-
% of frequency of service potential improvement due to delays & bottlenecks reduction	-
% of reliability improvement due to delays & bottlenecks reduction	-

■ Positive influence    
 ■ Negative influence    
 ■ Not relevant or no influence

## Sky sails system

### Technology Data

ID	Category	Transport modes	
FU25	Fuels and sources of energy	Maritime	
Description			
<i>It uses large towing kites for the propulsion of the ship. The tractive forces are transmitted to the ship via a highly tear proof, synthetic rope.</i>			
Readiness Level	Time to Market	Energy Source	Efficiency
9	<1	Wind	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
9	9	9	-

### Notes on technology

Depending on wind conditions this technology can provide considerable energy savings. Wind propulsion has been used for ages. In our days, novel materials and self-adjusting sail systems are introduced to this technology to improve its performance. Apart from the acquisition and installation costs, a marginal maintenance cost for this technology must be included. According to technology manufacturers it is possible to reach energy savings in the range of 5-20% (ideally), all depending on conditions and optimized used of installed equipment. On average, the energy savings from sky sails are up to 6-7%. The average speed will not be affected, but the utilisation of wind energy allows the captain to reduce the engine thrust while still maintaining the same speed. This gives corresponding savings in CO<sub>2</sub> and SO<sub>x</sub>. As with the average speed KPI, it is assumed that both frequency of service and the reliability of service will not be affected by the technology. This since it is very unlikely that any user of this technology will rank fuel saving, above the ability to deliver according to customer expectations (e.g. delivering on-time).

## Waste heat recovery system

### Technology Data

ID	Category	Transport modes	
FU26	Fuels and sources of energy	Maritime	
Description			
It passes exhaust gases from the ship's main engine through a heat exchanger to generate steam for a turbine driven generator the electrical power generated assists ship propulsion or supplies shipboard services.			
Readiness Level	Time to Market	Energy Source	Efficiency
0	0	Electrical	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
0	0	0	-

### Notes on technology

"Waste heat recovery systems are used to recover part of the main engine exhaust gas thermal energy, in order to produce steam and, thereby, electrical power in a steam turbine generator. Heat recovery systems could be applied to all Mare Nostrum corridor segments related to trades operated by large vessels, in order to improve the energy efficiency of baseline diesel engines propulsion. For the Mare Nostrum container ships, a fuel saving gain of 2-7% was assumed. The gains from waste heat recovery (WHR) mainly depend on the system size and complexity. Using phenomenological process modelling of the system, the energy efficiency and environmental performance can be predicted and optimised. The benefits from waste heat recovery are higher for large ships due to the economies of scale. A main drawback is the space requirement for the installation of the heat recovery system, which results in cargo capacity reduction. Therefore, for small ships such systems may be a highly costly option.

### High Level Benchmark

## Low emission engines

### Technology Data

ID	Category	Transport modes	
HT07	Cargo Handling and Transfer	Maritime, Inland Waterways, Railway, Road	
Description			
Replacement of old handling equipment by new machines fitted with Euro III/ IV compliant engines. While the upfront capital cost is higher in abt 15K euros/unit, these engines burn diesel more efficiently, give the engine more power while reducing emission of CO2 and providing up to 5% reduction on fuel consumption			
Readiness Level	Time to Market	Energy Source	Efficiency

## Horizontal container (un)loading

### Technology Data

ID	Category		Transport modes
HT10	Cargo Handling and Transfer		Railway
Description			
Metrocorgo is an innovative solution for containers cargo handling in overhead electrified railways, it's a containers horizontal movement system from an automated platform to train wagons. This technology is ready to experimentation. Metrocorgo will be tested on new Maersk's Platform in Vado Ligure (SV), Italy.

## Cargo Cassette and Translifter for cargo cassette

### Technology Data

ID	Category	Transport modes	
HT11	Cargo Handling and Transfer	Maritime	
Description			
<p>Wheelless cassette is a loading platform which is used together with a translifter in a cassette system. Cassettes are specially designed depending on the cargo and handling type. Translifter is a steerable lifting trailer which together with cassettes replaces roll trailers in Ro-Ro (Roll on-Roll off-ship) and StoRo (Stowable Ro-Ro) handling.</p>			
Readiness Level	Time to Market	Energy Source	Efficiency
9	<1	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
0	0	0	0

### Notes on technology

This technology has been chosen due to the importance of designing smart solutions for efficient (un)loading operations allowing for fast turn-around times for vessels in ports, while also enabling advances in intermodal cargo handling (e.g. cargo shift between transport modes). Cargo handling technology is a critical component for securing efficient and effective transfer of cargo between transport modes (e.g. reducing vessel port turnaround time), and thus an important prerequisite for establishing intermodal transport solutions. Since this technology has main focus on increasing terminal efficiency, the emission of CO<sub>2</sub> and SO<sub>x</sub> are not expected to be significantly reduced. This is based on the assumption that the majority of energy is consumed by the transport mode during transit. However, since the technology allows for increased speed of (un)loading operations, the potential for much faster turnaround time is present. This may also affect the level of reliability, as fast loading increases the operator's ability to deliver according to schedule. Also, the increase in turnaround time may be utilised for achieving two main goals: lowering the operational speed at sea, and thereby reducing the energy consumption and emissions to air, while still upholding the same level of service frequency; creased reliability by more efficient operations in port due to less waiting time for available quay space.

### High Level Benchmark

Baseline	Traditional container cargo handling
Relative Cost	
% cost savings during operation	Positive: based on the assumption that tech will lead to increased cargo through put
CAPEX	-
% fuel savings	-
Emissions	
% CO <sub>2</sub> savings	-
% SO <sub>x</sub> savings	-
% NO <sub>x</sub> savings	-

### Service & bottlenecks

% operational or infrastructural delays reduction	<span style="color: green;">■</span>	Potential for faster ship turn around due to increased efficiency during loading and unloading operations
% of frequency of service potential improvement due to delays & bottlenecks reduction	<span style="color: green;">■</span>	Possible to increase frequency, but highly dependent on operational conditions
% of reliability improvement due to delays & bottlenecks reduction	<span style="color: green;">■</span>	Difficult to quantify, but has a potential positive effect

■ Positive influence     
 ■ Negative influence     
 ■ Not relevant or no influence

## Green schemes to improve RTGs emissions and noise

### Technology Data

ID	Category	Transport modes	
HT09	Cargo Handling and Transfer	Inland Waterways, Road, Maritime, Railway	
Description			
Addition of a super-capacitor on RTGs. When RTGs engine is running, it charges the super capacity at the same time, and when super capacitor is fully charged, it will supply electricity to the cranes when it is hoisting a container			
Readiness Level	Time to Market	Energy Source	Efficiency

## FlexiWaggon

### Technology Data

ID	Category	Transport modes	
HT36	Cargo Handling and Transfer	Railway	
Description			
Flexiwaggon can combine lorries, buses, cars, containers on one and the same waggon. Individual loading and unloading of waggons. Loading and unloading is done horizontally which means no consideration is necessary for overhead contact lines. The emissions will be reduced by 75%, including carbon dioxide emissions

# Innovative units and treatment

## Braking energy recovery

### Technology Data

ID	Category	Transport modes	
LU13	Innovative units and treatment	Railway	
Description			
Recovery of dynamic braking energy and restitution to national grid / Reversible DB Substaion			
Readiness Level	Time to Market	Energy Source	Efficiency
	medium-term	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
saving	Reduktion im Umfang der Bremsenergie	Reduktion	---

### Notes on technology

This technology has been analysed together with technology LU14 - Onboard energy storage systems. Regenerative braking is a mature and relatively standard technology in new trains. A conventional electric train braking system uses dynamic braking, in which the train kinetic energy is dissipated as waste, like heat. With the use of regenerative braking, the current in the electric motors is reversed, slowing down the train, while the motors generate electricity and return it to the power distribution system. This electricity can be used to power other trains, or to offset power demands of other loads, like lighting. Friction brakes are still needed as backup in the case that the regenerative brakes fail. However, the power recovered via regenerative braking can only be used simultaneously. In order to recover this energy at a different phase in time, an energy storage system is required. Super-capacitors, batteries, and/or flywheels can serve as energy storage systems. A flywheel is a mechanical device with a significant moment of inertia used as a storage device for rotational energy. Flywheel energy storage or the rotational energy of a flywheel, and rechargeable electric traction batteries are also used as storage systems. Batteries are electrochemical energy storage systems. A super-capacitor is a tool offering very high electrical capacitance in a small package. On-board energy storage systems deliver an enormous potential for energy saving in traction applications. The most suitable vehicle application might be a Diesel Multiple unit where energy storage (LU14) and reuse of brake energy (LU13) can recover the normally wasted brake energy and lead to energy savings up to 30 to 40% (Railenergy project). This saving can be measured directly in terms of reduced fossil fuel consumption per 100km. In addition there will be emission savings in the same order or even higher, since the small diesel engine can be operated in an optimal fashion. The optimal size and operation mode of such a storage system depends on the considered application and operating conditions. Reversible DC substation is able to recover into the upstream network the regenerative braking energy; this is done by association of controlled rectifier/inverter with specific control to be able to recover the braking energy between the nominal voltage ( $U_n$ ) and maximal voltage ( $U_{Max2}$ ) according to the EN standard ref EN 50163. The advantages against the baseline technologies are: - Maximum efficiency over parallel inverter, storage systems (Flywheel and Supra Capacitors). - Diode rectifier to be able to cancel braking resistors on board of traction units. The effects from the application of LU13 and LU14 on the rail routes connecting Shanghai to Brest/Malaszewicze and Slubice Kunowice are assessed. For the LU13 & LU14 combination, the estimation for energy savings is 30 to 40%. Thus, the block train CO<sub>2</sub> emissions would drop from 41gr/tkm (baseline) to the range of 24.6-28.7 gr/tkm. The energy savings would, also, affect the transport costs, as the electricity bill would benefit from the consumption reduction. However, this is difficult to quantify, since no relevant information is available in the baseline description.

## Electric Locomotive

### Technology Data

ID	Category	Transport modes	
VE02	Vehicles	Railway	
Description			
NS 999 is an entirely electric locomotive that uses a lead-acid energy storage system without the use of a diesel engine and with zero exhaust emissions.

## Hybrid Truck

### Technology Data

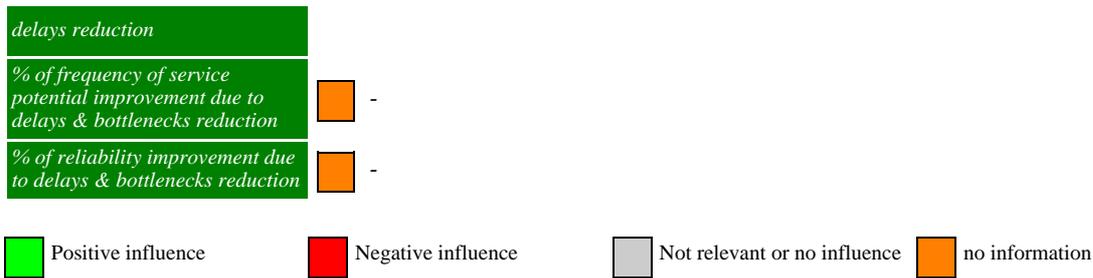

ID	Category	Transport modes	
VE03	Vehicles	Road	
Description			
<i>The M2e Hybrid Freightliner; Support engine plus auxiliary drive to operate an elevating platform of the truck; combination of 6 cylinder engine plus electrical engine</i>			
Readiness Level	Time to Market	Energy Source	Efficiency
9	<1	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
ca. 25% less than Diesel	ca. 25% less than Diesel	--	n.a.

### Notes on technology

A hybrid truck combines the conventional diesel engine with an electrical motor for auxiliary power generation, resulting in fuel economy and reduction of CO<sub>2</sub> emissions. The hybrid system includes a lithium-ion battery, which is recharged through regenerative braking. Other indicative features are: (a). the added power boost for hills or rapid acceleration using the electric motor and (b). the engine turning-off when the service brake is applied. The application of hybrid trucks has been evaluated for the Brenner and Cloverleaf corridors. According to the first benchmarking level, the potential benefits from the use of hybrid trucks compared to conventional diesel vehicles include 60-80% fuel savings and relevant reduction of emissions. If conventional diesel fuel is used, then 60-80% CO<sub>2</sub> and SO<sub>x</sub> emissions' reduction are estimated. However, this figure is general and can change according to the driving profile, the hybrid system in use, and other factors. Assuming an average loading factor of 85% per trip (no data on loading factor are given in the baseline description) and typical vehicle characteristics on engine power and fuel consumption, a 22-29% fuel cost factor is estimated.

### High Level Benchmark

Baseline	<i>If the truck is during operation, then the baseline technology is a conventional diesel truck. If it is idle, the baseline technology to compare with is the fuel (diesel).</i>	
Relative Cost		
% cost savings during operation		-
CAPEX		-
% fuel savings		60-80%
Emissions		
% CO <sub>2</sub> savings		80%
% SO <sub>x</sub> savings		-
% NO <sub>x</sub> savings		-
Service & bottlenecks		
% operational or infrastructural		-

## Aerodynamic drag improvements

### Technology Data

ID	Category	Transport modes	
VE29	Vehicles	Road	
Description			
<i>Aerodynamic mirrors, cab side extenders, integrated cab roof fairings, aerodynamic front bumper, full fuel tank fairings, trailer side skirt fairings, trailer gap fairing, rear mounted trailer fairing. Ref to the "Reducing heavy-duty long haul combination truck fuel consumption and CO2 emissions report" <a href="http://www.nescaum.org/documents/heavy-duty-truck-ghg_report_final-200910.pdf/">http://www.nescaum.org/documents/heavy-duty-truck-ghg_report_final-200910.pdf/</a></i>			
Readiness Level	Time to Market	Energy Source	Efficiency
9	available	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
<i>reduction potential 10-26%</i>			<i>0</i>

### Notes on technology

Aerodynamic drag improvements of the truck structure can bear a saving potential of 10-26% for emissions (CO<sub>2</sub>, NO<sub>x</sub> and SO<sub>2</sub>) and energy consumption. Drag improvements are applicable to the mirrors, the cab side extenders, the integrated cab roof fairings and the aerodynamic front bumper. The California Global Warming Solutions Act of 2006 established a program to reduce GHG emissions through regulatory and market mechanisms; the target is to achieve an approximately 30% reduction of GHG emissions by 2020. For this purpose, a Climate Change Scoping Plan was adopted in December 2008, in order to indicate how emission reductions could be achieved from significant GHG sources via regulations, market mechanisms, and other actions. The scoping plan includes two regulations on the GHG emissions from heavy-duty vehicles. The first action measure was adopted in December 2008 and required new and in-use trucks with 53 foot or longer trailers operating in California to achieve aerodynamic drag and rolling resistance improvements via certified new equipment and retrofits. New tractors and trailers must meet the requirements by 2011, in-use tractors by 2012, and in-use trailers by 2014. In [NESCCAF, 2009], an assessment of technologies to reduce GHG emissions and fuel consumption from new heavy-duty trucks in the timeframe from 2012 to 2017 is provided. According to the report, currently available technologies for heavy-duty trucks like aerodynamic drag improvements and improved tires are evaluated as good as more advanced technologies, such as bottoming cycle and variable valve actuation.

## Low rolling resistance tires

### Technology Data

ID	Category	Transport modes	
VE33	Vehicles	Road	
Description			
<i>Tires which are designed to minimize the energy wasted as heat as the tire rolls down the road</i>			
Readiness Level	Time to Market	Energy Source	Efficiency
9	<1	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
10% reduction estimated by 2050	0	0	0

### Notes on technology

Low rolling resistance tires are designed to minimize the energy wasted as heat as the tire rolls down the road. A 1.4-4.5% reduction of CO<sub>2</sub> emissions is referenced in the relevant literature. An important feature of lower rolling resistance tires is that the traction and braking performance often suffer due to lower resistance. For the one hand, a balance must be achieved that both energy saving benefits and safety are achieved, [NESCCAF, 2009]. In this respect, good road infrastructure conditions should support the effectiveness of such measures.

### High Level Benchmark

## Route optimisation system (scheduling)

### Technology Data

ID	Category	Transport modes	
NA16	Navigation technologies	Inland Waterways	
Description			
"The advising Tempomaat (ATM) is a system enabling an economically optimised operation of a			
Readiness Level	Time to Market	Energy Source	Efficiency
	<1	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
-	-	-	-

### Notes on technology

Optimal route planning in inland waterways aims at energy savings, by advising the skipper to optimally select the route and speed of the vessel, in order to arrive on time with a most efficient use of fuel. The technology benefits were analysed in the framework of the EC-funded project CREATING (Concepts to Reduce Environmental impact and Attain optimal Transport performance by Inland NaviGation). According to this study, up to 10% reduction of NO<sub>x</sub>, PM and CO<sub>2</sub> emissions can be achieved.

### High Level Benchmark

Baseline	No route optimisation system	
Relative Cost

## River Information Services (RIS)

### Technology Data

ID	Category	Transport modes	
NA17	Navigation technologies	Inland Waterways	
Description			
<p><i>River Information Services (RIS) are customized information services for inland waterway transport and make it possible to coordinate logistical processes with actual transport situations on a constant basis. RIS play a key role in making cargo transport and passenger services on waterways more efficient leading to a reduction of fuel consumption by approximately 5 %, while at the same time increasing traffic safety .</i></p>

# Carbon-free rail freight transport

## Technology Data

ID	Category	Transport modes	
BP07	Best Practices	Railway	
Description			
<p><i>Now you can have your goods transported carbon-free on all European rail freight transport routes. DB Schenker Rail replaces the electricity required for your freight transport with regenerative energy that comes 100% from renewable sources in Germany. This helps to avoid carbon emissions right from the outset. Even the smallest quantities can be transported in this way without carbon emissions, on a national and international scale.</i></p>

## Integrated shortsea transport

### Technology Data

ID	Category	Transport modes	
BP08	Best Practices	Maritime	
Description			
The concept of Coaster Express (CoEx) is a short sea transport concept directed to bundling the transport flows, scaling-up the short sea facilities and standardization and automation of the transition processes.			
Readiness Level	Time to Market	Energy Source	Efficiency
	-	-	-
CO <sub>2</sub>	NO <sub>x</sub>	SO <sub>x</sub>	LCC
-	-	-	-

### Notes on technology

Integrated short sea transport and logistics concepts for the accommodation of large container feeding include designs of smart docking and automated transshipment port systems. Coaster Express (CoEx) is a concept for automated container terminal concept for short sea applications directed to bundling the transport flows, scaling-up the short sea facilities and standardization and automation of the transition processes. However, it is only on a conceptual stage and it is difficult to determine its impact on the greening of corridors. The automation of operation may provide an estimated increase in cargo throughput and service speed increase service of approximately 43%.

### Notes on technology

EREX is a railway system that has been designed by the European Railway Energy Saving Solution (ERESS), to help railways to save money and reduce CO<sub>2</sub> emissions by providing accurate billing based on actual consumption. EREX is an energy settlement system that enables the infrastructure managers to calculate the accurate energy consumption of their clients and the railway undertakings to understand their use of energy, apply smarter driving and, thus, save energy and costs. The EREX system is comprised of: advanced energy meters mounted on board trains; an energy measurement system, which collects and validates the measured data; a system that performs the settlement, cost distribution, data exchange and billing. According to the literature, the application of this technology provides the ability to design energy saving programs of up to 15% - 30% energy and cost savings. As a documented example the Norwegian National Railway (NSB) started an energy saving project in 2005 based on measured energy data. Between 2004 and 2011 the energy efficiency was improved by 20.5%. This project has thereby allowed NSB to achieve substantial cost savings. The EREX system is, also, designed for cross-European railway traffic, irrespective of the country or the operators, giving the opportunity to calculate the exact energy bill at every country where the train travels.

### High Level Benchmark

Baseline	no application of the Best Practice	
Relative Cost		
% cost savings during operation		-
CAPEX		-
% fuel savings		-
Emissions		
% CO <sub>2</sub> savings		up to 15%
% SO <sub>x</sub> savings		-
% NO <sub>x</sub> savings		-
Service & bottlenecks		

% operational or infrastructural delays reduction	■ -
% of frequency of service potential improvement due to delays & bottlenecks reduction	■ -
% of reliability improvement due to delays & bottlenecks reduction	■ -

■ Positive influence    
 ■ Negative influence    
 ■ Not relevant or no influence    
 ■ no information

### Detailed Benchmark

(with respect to baseline performance on specific corridor)

Corridor	Cloverleaf	
Mode of transport	Rail	
Cost	Min: 1.5%	Max: 2.0%
CO2 emissions	Min: 0.0%	Max: 0.0%
SOX emissions	Min: 0.0%	Max: 0.0%
Average speed	Min: 0.0%	Max: 0.0%
Frequency	Min: 0.0%	Max: 0.0%
Reliability	Min: 0.0%	Max: 0.0%
